Contactless Lift Button

In a constraint and enclosed space inside the lift cabin, bacteria and virus expelled when a person coughs or sneezes, can land on lift buttons and survive for a long period. There is a primary concern that virus are easily propagated under such ideal condition.

How it works
Hitachi Touchless button comes with a built-in infrared (IR) sensor that will detect any approaching finger that comes in proximity of 1 to 3 cm from the button surface.

Advantage
Unlike conventional push button, it will reduce the chance of any accidental virus transmission, making it safe for everyone to use the lift.

This button also work like a conventional push button, so it can serve as a long-term solution that makes the lift future-ready when similar when concern or other pandemic does arise.
Contactless Lift Button

Protection begins when you arrive at the lift lobby

Option

Model Name : BT-2493-3D
