## HITACHI

#### NOTE

All information in this manual is based on the latest product information available at the time of printing. Hitachi has reviewed the accuracy of this manual, but assumes no responsibility for any omissions or errors which may appear. The design of the product is under constant review and, while every effort is made to keep this manual up to date, the right is reserved to change specifications and equipment at any time without prior notice.

#### PROHIBITION

These products should not be used for medical, power supply, nuclear, water supply, drainage plants, traffic control, military, space, nor disaster prevention equipment.

Diversion and/or resale of these products without this manual is prohibited.

Reproduction of the contents of this manual in whole or in part, without written permission of Hitachi, is prohibited.

#### TRADEMARKS

HITACHI-S10/2 $\alpha$ , S10/4 $\alpha$  and PSE $\alpha$  are registered trademarks of Hitachi, Ltd.

FIRST EDITION, FEBRUARY, 1999, SAE - 3 - 132 (B) (out of print) SECOND EDITION, NOVEMBER, 2000, SAE - 3 - 132 (D) (out of print) THIRD EDITION, SEPTEMBER, 2003, SAE - 3 - 132 (F) All Rights Reserved, Copyright © 1999, 2003, Hitachi, Ltd.

#### LIMITED WARRANTY

Hitachi, Ltd., warrants its products to be manufactured in accordance with published specifications and free from defects in materials and/or workmanship.

Hitachi, Ltd., warrants its products against defects in parts and workmanship for one full year from date of purchase.

HITACHI, LTD., MAKES NO WARRANTIES, EITHER EXPRESS OR IMPLIED EXCEPT AS PROVIDED HEREIN, INCLUDING WITHOUT LIMITATION THEREOF, WARRANTIES AS TO MARKETABILITY FOR A PARTICULAR PURPOSE OF USE, OR AGAINST INFRINGEMENT OF ANY PATENT. IN NO EVENT SHALL HITACHI BE LIABLE FOR ANY DIRECT, INCIDENTAL OR CONSEQUENTIAL DAMAGES OF ANY NATURE, OR COSTS, CHARGES, LOSSES OR EXPENSES RESULTING FROM ANY DEFECTIVE PRODUCT OR THE USE OF ANY PRODUCT.

#### SOFTWARE UP-TO DATE POLICY

Hitachi, Ltd., constantly reviews its software so as to incorporate the latest technology. Hitachi reserves the right to make changes to any software to improve reliability, function, or design. Hitachi cannot be held responsible for any errors in its software.

## SAFETY PRECAUTIONS

- Read this manual thoroughly and follow all the safety precautions and instructions given in this manual before operations such as system configuration and program creation.
- Keep this manual handy so that you can refer to it any time you want.
- If you have any question concerning any part of this manual, contact your nearest Hitachi branch office or service engineer.
- Hitachi will not be responsible for any accident or failure resulting from your operation in any manner not described in this manual.
- Hitachi will not be responsible for any accident or failure resulting from modification of software provided by Hitachi.
- Hitachi will not be responsible for reliability of software not provided by Hitachi.
- Make it a rule to back up every file. Any trouble on the file unit, power failure during file access or incorrect operation may destroy some of the files you have stored. To prevent data destruction and loss, make file backup a routine task.
- Furnish protective circuits externally and make a system design in a way that ensures safety in system operations and provides adequate safeguards to prevent personal injury and death and serious property damage even if the product should become faulty or malfunction or if an employed program is defective.
- If an emergency stop circuit, interlock circuit, or similar circuit is to be formulated, it must be positioned external to the programmable controller. If you do not observe this precaution, equipment damage or accident may occur when the programmable controller becomes defective.
- Before changing the program, generating a forced output, or performing the RUN, STOP, or like procedure during an operation, thoroughly verify the safety because the use of an incorrect procedure may cause equipment damage or other accident.

## "RUN/STOP" SWITCH CAUTION

The "RUN/STOP" switch only stops execution of the ladder logic program or HI-FLOW program. Digital and analog outputs are left in the active state when execution stops, unless the optional rungs described in the CPU manual have been added. The "RUN/STOP" switch does not affect the operation of C-language or FA-BASIC language programs. Outputs can still be produced in response to C-language or FA-BASIC programs, or by the action of programmers typing in commands in these languages, while the "RUN/STOP" switch is in the "STOP" position.

DO NOT DEPEND ON THE STOP SWITCH TO STOP MOVING PARTS OR TO PREVENT UNEXPECTED MOTION OR ENERGIZATION. USE HARDWIRED SAFETY DISCONNECT AND LOCK OUT POWER AND CONTROL VOLTAGES BEFORE WORKING ON ELECTRICAL CIRCUITS OR PARTS THAT CAN MOVE.

## PREFACE

We greatly appreciate your purchase of this HI-FLOW system.

This system, running on a personal computer, is used for creation and correction of HI-FLOW application program, and many other operations.

This manual describes the operation of the HI-FLOW system.

This manual is applicable to the following system versions.

System name/version HI-FLOW SYSTEM For Windows® 07-02

For HI-FLOW program (instruction), refer to the manual listed below.

<Table of Systems Supported by Windows® 2000 and Windows® XP>

 $\sqrt{1}$ : Supported ns: Not supported

(\*1) Crossing C compiler (No.28) is not supported by Windows® XP. Use it on Windows® 2000.

(\*2) Crossing C compiler (No.28) must be a version supported by Windows® 2000 (later than version 5.3) as a premise.

<Definitions of Terms>

- N coil: A ladder program converted into a form that can be run on the PCs by pasting a symbol on the sheet displayed on a PC.
- Process: A HI-FLOW program converted into a form that can be run on the PCs by pasting a symbol on the sheet displayed on a PC.
- Compile: To convert an application program such as a ladder chart and HI-FLOW into a form (N coil, process, etc.) that can be run on the PCs.
- Build: To compile only a corrected application program.
- Rebuild: To compile every existing application program.
- Sheet: Paper to prepare an application program of ladder chart and HI-FLOW, etc. This paper is controlled on a PC.
- PCs: An abbreviation of <u>Programmable Controllers</u>.
   This is a general term for PLC such as the S10α and S10mini series.
- PLC: An abbreviation of <u>Programmable Logic Controller</u>. This is an industrial electronic device to exert sequence control, having an incorporated program.

The S10 $\alpha$  and S10mini series come under this PLC.

<Note for storage capacity calculations>

- Memory capacities and requirements, file size and storage requirements, etc. must be calculated according to the formula 2<sup>n</sup>. The following examples show the results of such calculations by 2<sup>n</sup> (to the right of the equals signs).
  - 1 KB (kilobyte) = 1024 bytes
  - 1 MB (megabyte) = 1,048,576 bytes
  - 1 GB (gigabyte) = 1,073,741,824 bytes
- As for disk capacities, they must be calculated using the formula 10<sup>n</sup>. Listed below are the results of calculating the above example capacities using 10<sup>n</sup> in place of 2<sup>n</sup>.
  - 1 KB (kilobyte) = 1000 bytes
  - 1 MB (megabyte) =  $1000^2$  bytes
  - $1 \text{ GB} (\text{gigabyte}) = 1000^3 \text{ bytes}$

## 1 BEFORE USE

## 1 BEFORE USE

This manual is intended for users who want to program a personal computer under the Windows®.

## 1.1 System Overview

HI-FLOW For Windows<sup>®</sup> (hereinafter referred to as the HI-FLOW system) is used to create, correct, monitor, and debug HI-FLOW application program for the  $2\alpha$  series and S10mini series. The HI-FLOW system can be operated in the same way as ordinary Windows<sup>®</sup> applications are operated.

## **1.2 Hardware and Software Requirements**

Using each system requires the following hardware and software.

OS	Windows® 95 (*1) Windows® 98 (*1)	Windows® 2000 (*1)	Windows® XP (*1) (*2)		
CPU	Pentium 133 MHz or more	Pentium 300 N	MHz or more		
Memory (RAM)	32 MB or more	64 MB or more	128 MB or more		
Free hard disk capacity (*3)	20 MB or more/system (However, 10 MB or more/system for OS loading and option module support software)				
Floppy disk drive	1 unit or more (required to in	nstall software by FD)			
CD-ROM drive	1 unit or more (required to in	nstall software by CD-R	OM)		
Ethernet (10BASE-T)	1 port or more (required to connect a PC with the ET.NET module)				
Serial (D-sub 9-pin)	1 port or more (required to c an IP address for the ET.NE		C by RS-232C or set		
PC card (conforming to the PC Card Standard (JEITA V4.2) TYPE II or TYPE III)	<ul> <li>1 slot or more (required to connect a PC with the parallel interface module (LWZ400). At this time, the following GP-IB card is also required.)</li> <li>GP-IB card: PCMCIA-GPIB (Model: 777438-02) (manufactured by National Instruments Corporation)</li> </ul>				
Display	Resolution of $800 \times 600$ pixels or more				
Microsoft® Internet Explorer	Version 4.01 or later				

#### <Personal Computers (hereafter abbreviated as PC)>

(\*1) For the OS service pack, refer to the attached reference materials for software.

(\*2) No.10 and No.28 in <Table of Systems Supported by Windows® 2000 and Windows® XP> in "PREFACE" are excepted.

(\*3) This is a capacity required to install each system. A free capacity to save user programs is also required.

<Hardware other than PC>

- CPU for HITACHI-S10 $\alpha$  series (2 $\alpha$ ) or S10mini series
- Power supply for HITACHI-S10α series or S10mini series
- Backboard for HITACHI-S10 $\alpha$  series or S10mini series
- Connection cable between the personal computer and PCs
- Remote I/O stations, other power supplies and backboards, cards, and wiring as required

## **1.3** Precautions

1.3.1 Precautions to be observed during the use of the NX/Tools-S10 system The NX/HOST-S10 programs transferred to the PCs by the NX/Tools-S10 system use the following areas depending on the type. When you use the NX/Tools-S10 system in conjunction with HI-FLOW, perform the following loading procedures to avoid an area overlap.

<Areas used by NX/HOST-S10> TYPE1: /120000 to /15D800 TYPE2: /120000 to /163000 TYPE3: /120000 to /180000 TYPE4: /120000 to /164000 TYPE5: /120000 to /16E800 TYPE6: /120000 to /195800

- (1) Loading HI-FLOW when the NX/HOST-S10 system is already loaded in the PCs
  - ① Stop the PCs.
  - ② First, load only the HI-FLOW system program into the PCs.
     (Operation: Select [Utility] [PCs] [Delete process of PCs], and [Exchange all process and system] in sequence.)
  - ③ After completion of system program loading, use the system edition function to define the user area so that it does not overlap with the above NX/HOST-S10 area.
     (Operation: Select [Utility] [PCs], and [System edition] in sequence.
  - ④ Transfer the HI-FLOW programs (processes) to the PCs.

#### 1 BEFORE USE

- (2) Loading NX/HOST-S10 when HI-FLOW is already loaded in the PCs
  - ① Stop the PCs.
  - ② Receive all the HI-FLOW programs (processes) from the PCs and saves them on the personal computer you are operating.
  - ③ Use the system edition function to define the user area so that it does not overlap with the above NX/HOST-S10 area.
  - ④ Transmit the saved HI-FLOW programs back to the PCs.
  - ⑤ Transmit the NX/HOST-S10 system to the PCs.
  - (6) (Performing Steps (4) and (5) in reverse order will cause no problem.)
- 1.3.2 HI-FLOW system replacement

The message below appears on the display when the HI-FLOW system establishes an on-line condition with the PCs. Then, be sure to replace the HI-FLOW system on the PCs (CPU unit side).

Replacing the system deletes all the existing HI-FLOW programs (processes) on the PCs side. Therefore, be sure to save the programs to the personal computer before making a system replacement.

- (1) Replacing the HI-FLOW system
  - ① Stop the PCs.
  - ② Select [Utility] [PCs] [Delete process of PCs], and [Exchange all process and system] in sequence.
  - ③ When the system is replaced, all the processes are deleted from the PCs. Therefore, retransmit all the HI-FLOW programs (processes) to the PCs.

## NOTICE

Users of this product require knowledge of the Windows® environment and user interface. The HI-FLOW system conforms to the Windows® standard. This manual is intended for users who have mastered the basic usage of Windows®.

- This product can be used to rewrite programs or the content of internal registers while the PCs are running. However, if they are rewritten without sufficient care, a serious accident such as damage to a facility may occur. Check the condition of the facility before rewriting programs or the content of internal registers.
- When you use a personal computer with the suspend function, disable the function. The personal computer may malfunction if the suspend function remains enabled during execution of the HI-FLOW debugger system.
- If RAM runs short during execution of an application program, an application error may result. When this happens, check the free memory capacity and, if the RAM needs to be extended, do it.

THIS PAGE INTENTIONALLY LEFT BLANK.

# 2 INSTALLATION

## 2.1 Installing the System (\*)

First, check if your CD is correct.

To install each system, double-click the Setup.exe file saved in the DISK1 folder of the system CD. After installing it, an installed program window is not displayed.

To install each system, install Microsoft® Internet Explorer 4.01 or later. If it is not installed, install each system after installing it.

## NOTE

- To operate each system, install Microsoft® Internet Explorer 4.01 or later. If it is not installed, each system does not operate normally.
- Before installing each system, be sure to terminate such a program residing in the memory as virus monitoring software. If each system is installed without terminating the program, an error may occur. In this case, uninstall the system by referring to "2.2 Uninstalling the System" and terminate all Windows® programs. Then, install each system once again.
- To install and uninstall each system by using Windows® 2000, set "Administrator" or "Member of Administrators" as the user account to be logged on.
- To install and uninstall each system by using Windows® XP, set "Computer administrator" as the user account to be logged on. If "Account with limitations" is set, each system does not operate normally.
- (\*) No.10 and No.28 in <Table of Systems Supported by Windows® 2000 and Windows® XP> in "PREFACE" are excepted.

## 2.2 Uninstalling the System (\*)

To uninstall each system for version-up, observe the following procedure.

## (1) Uninstalling from Windows® 95 or Windows® 98

Open [Settings] in the [Start] menu – [Control Panel]. Double-click [Add/Remove Programs], select "Each System" by the [Install/Uninstall] tab, and click the Change/Remove button. When the [Confirm File Deletion] window is displayed, click the Yes button.

(2) Uninstalling from Windows® 2000

Open [Settings] in the [Start] menu – [Control Panel]. Double-click [Add/Remove Programs], click [Change or Remove Programs], select "Each System," and click the Change/Remove button. When the [Confirm File Deletion] window is displayed, click the Yes button.

(3) Uninstalling from Windows® XP

Open ([Settings] – ) [Control Panel] in the [Start] menu. Double-click [Add or Remove Programs], click [Change or Remove Programs], select "Each System," and click the Change/Remove button. When the [Confirm File Deletion] window is displayed, click the Yes button.

When a shortcut of each system executable file has been created on the desktop, etc. delete this shortcut.

## NOTE

- When the [Remove Shared File?] window is displayed while each system is uninstalled on Windows®, click No not to delete the shared file.
- To install and uninstall each system by using Windows® 2000, set "Administrator" or "Member of Administrators" as the user account to be logged on.
- To install and uninstall each system by using Windows® XP, set "Computer administrator" as the user account to be logged on.
- If the [Add/Remove Programs] window is locked (inoperable) when each system is uninstalled by using Windows® 2000, log off from [Shut Down] in the [Start] menu of Windows®, and then log on again on the [Log On to Windows] window.

<sup>(\*)</sup> No.10 and No.28 in <Table of Systems Supported by Windows® 2000 and Windows® XP> in "PREFACE" are excepted.

### 2 INSTALLATION

## 2.3 Starting Up the System (\*)

 The system to be installed by each system is automatically registered in the [Start] menu of Windows®. From this [Start] menu, select [Programs (All Programs)] – [Hitachi S10] – "Each System" to start the system.

If the logged-on user name in installing each system is different from the user name in starting each system, each system is not displayed in the [Start] menu. In this case, create a shortcut of the executable file (extension .exe) for each system shown below and then double-click this shortcut to start each system.

No.	System name	Туре	Executable file storage directory (*1)	Executable file name

<Executable File Storage Directory Table>

(\*1) Directory name when "C" is the drive name of installing destination.

(\*) No.10 and No.28 in <Table of Systems Supported by Windows® 2000 and Windows® XP> in "PREFACE" are excepted.

## 2.4 Terminating the System

To terminate the HI-FLOW system, select [Application termination] from the [File] menu. When the system terminates, the Windows® screen appears again.

THIS PAGE INTENTIONALLY LEFT BLANK.

# 3 HI-FLOW SHEETS

#### 3 HI-FLOW SHEETS

Application programs in the HI-FLOW system have a structure different from that of their DOS versions. Programs on the PCs are handled in the same way as in both the HI-FLOW system and DOS system. In the HI-FLOW system, however, application programs are handled as sheets on a personal computer.

## 3.1 Relationship with DOS Version Files (e.g., .PSE)

HI-FLOW is capable of reading various DOS version files and saving them in a specified extension format. Use the conversion feature ([File] - [FD] - [Read]) or save in a specified format ([File] - [FD] - [Save]).

## 3.2 HI-FLOW Sheets

The HI-FLOW system manages the following types of sheets.

- HI-FLOW process sheet
- HI-FLOW sheet

One of these types is specified when creating a new sheet or opening an existing sheet.

## 3.3 HI-FLOW Process Sheets

The HI-FLOW system visually manages HI-FLOW programs for each process. HI-FLOW process sheets provide all necessary information for visual management of multiple processes.

A HI-FLOW process sheet is an equivalent of the process list screen in the DOS version.

	uzd.

Clicking a process icon on the process sheet opens a HI-FLOW sheet.

### 3 HI-FLOW SHEETS

## 3.4 HI-FLOW Sheets

HI-FLOW sheets contain HI-FLOW programs that are managed on HI-FLOW process sheets. Up to 256 HI-FLOW sheets can be created, and on each such sheet can up to 256 lines, or up to 999 steps, be coded (in the same language as used in the DOS version).

4	Sheeto	d.hifNo4		
		1	2	
1		Une 4 control WT100 (100) WT100 (100 )	10	14

7	۲ ۲ Kind o	ON R102 ON R102		V Offline

A HI-FLOW program can be created by entering HI-FLOW symbols. Paste registered HI-FLOW symbols from the symbol bar into the program by using drag-and-drop or other operations.

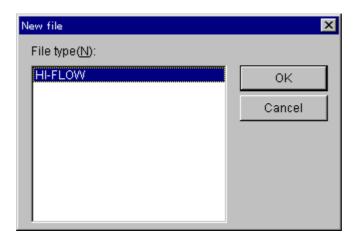

<HI-FLOW symbol bar>

This chapter outlines the functions of HI-FLOW process sheets and HI-FLOW sheets as well as the method of using these two types of sheet. For details, refer to the help provided by the HI-FLOW system.

## 4.1 Creating HI-FLOW Process Sheets

HI-FLOW process sheets are used to visually manage existing HI-FLOW sheets for each process. To create a HI-FLOW process sheet, select [File] menu – [New file].

Click the OK button and set the name of a new sheet on the following window.

Create new HI-FLOW	×
Name( <u>N</u> ):	0K
	Cancel
Position(P):	Help( <u>H</u> )
C:\Hitachi\s10\HI-FLOW	Refer( <u>B</u> )

To open an existing HI-FLOW process sheet, select [File] menu – [Open file].

Open					?	×
Look in: tempe tempo temps Af01.hif	<u></u> hf01 <u></u>	] [		Ť		
File <u>n</u> ame: Files of <u>t</u> ype:	HI-FLOW Files (*.hif)		•		<u>O</u> pen Cancel	]

When a new HI-FLOW process sheet is created, it is opened with no program provided. Any existing HI-FLOW process sheet, when opened by selecting [File] menu – [Open], inherits the state that existed when that process sheet was closed previously.

<mark>₩</mark> HI-FLOW - [old. ₩ File( <u>F</u> ) Edit(]		uild(B) Mode(M)	LING AND D	Window(W)

Push [F1] to displa	y Help			1, 1	0, 0 0, 0	) //,

Only one HI-FLOW process sheet can be opened at a time. When opening a HI-FLOW program from the HI-FLOW process sheet, double-click the HI-FLOW sheet icon on the HI-FLOW process sheet.

A HI-FLOW process sheet has the following eight main menus.

File:	Provides file-related functions, such as saving, reading, and printing HI-FLOW
	process sheets.
Edit:	Provides edit functions for editing HI-FLOW process sheets.
Display:	Provides functions related to display formats in the HI- FLOW system.
Build:	Provides functions related to compilation of HI-FLOW programs.
Mode:	Provides functions related to transmission and reception between the PCs and
	HI-FLOW programs.
Utility:	Provides utility functions.
Window	: Provides functions for operations on ladder sheet windows.
Help:	Provides help.

Toolbars also have the same functions as these menus.

## 4.2 HI-FLOW Process Sheet File Functions

The file functions for HI-FLOW process sheets are selectable from a pull-down menu.

1	HI-FLOV	¥ - [OLC	).hif]							_ 🗆 ×

10	Mnitor process3	Monitor	r temp in						-
Number of al	I processes : 13 Kind of co	ommunic	ation : RS-	232C COM	1			Offlin	e
					_		_		
1									
					C	), O	0, 0	0, 0	

The target to be edited and available functions vary, depending on which mode, offline or online, is currently enabled.

• Offline mode

Memory content in the personal computer or a file is edited.

• Online mode

Memory content in the personal computer or the file which matches that in the PCs is edited. To switch to online mode, make a match with the PCs through transmission or reception.

When the HI-FLOW system is started, it always enters offline mode. Use a pull-down menu to switch to online mode, if necessary.

No.	Level 1	Level 2	Leve	el 3	Description
1	Mode	Online	Send	All	Transmits all processes to the PCs and
			(PC -> S10)	processes	enables online mode.
2				Designated	Transmits a designated process to the PCs
				process	and enables online mode.
3			Receive	All	Receives all processes from the PCs and
			(S10 -> PC)	processes	enables online mode.
4				Designated	Receives a designated process from the
				process	PCs and enables online mode.
5			Unconditiona	al	Always enables online mode.
6		Offline			Switches to offline mode.
7		Free occupancy			Releases the lock set by the local
					personal computer.
8		Monitoring	Start monitor	ring	Starts monitoring.
9			Stop monitor	ring	Stops monitoring.
10		Debug	Trace		Traces and displays the operation of a
					process, starting when a given start
					condition is met and ending when a given
					end condition is met.
11			Time monito	r	Monitors time elapse from the time when
					a given start condition is met until when a
					given end condition is met.
12			Breakpoint		Sets or removes breakpoints.

The mode functions are described below.

Any HI-FLOW system on a network has a lock function compatible with that network. This is to prevent multiple such HI-FLOW systems from accessing the same PC simultaneously. When online mode is specified, the connected PCs are locked. The locked PCs are unlocked when the user selects the free occupancy menu.

Online mode may not be specified for the PCs that are already locked by the HI-FLOW system on another personal computer. If this happens, an error message is displayed and the specified online mode is invalidated.

## 4.6.1 HI-FLOW four-line simultaneous monitoring function

HI-FLOW system versions 7 and later (system floppy disk versions 07-00 and later) support the four-line simultaneous monitoring function that is exercised via an Ethernet. This function enables four personal computers to conduct simultaneous HI-FLOW monitoring operations with respect to one CPU unit. For the use of this function, the monitoring HI-FLOW system (program product type: S-7890-35) is required in addition to the HI-FLOW system.

The requirements for the use of the four-line simultaneous monitoring function are indicated below with a typical configuration.

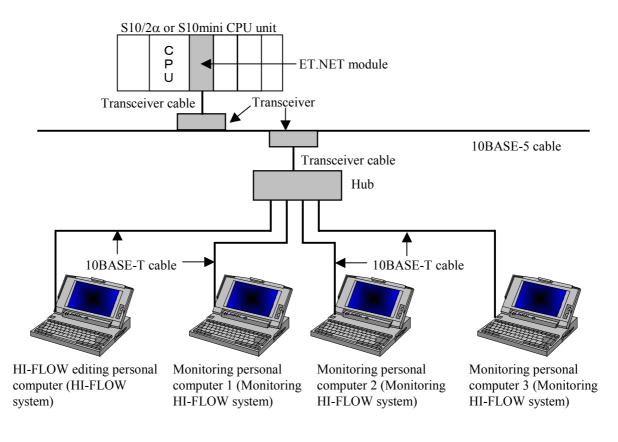

#### (1) Requirements

- The version of the employed ET.NET module must be as indicated below: LWE550: Version 4, Revision 1 or later (2α series) LQE020: Version 3, Revision 1 or later (S10mini series)
- The PCs must be connected to personal computers via Ethernet (the function supporting this is not available if the RS-232C or GP-IB interface is used).
- The PCs must be connected to personal computers via a LAN (the function supporting this is not available through the use of a one-to-one direct connection).
- Up to four personal computers can be simultaneously connected to the PCs. However, only one HI-FLOW editing personal computer (regular HI-FLOW system) must be used. The other personal computers must be dedicated to monitoring (up to three monitoring HI-FLOW system machines can be used).

#### (2) Limitations

Even when two ET.NET modules (main module and submodule) are connected to one CPU unit, up to four personal computers can be connected to that CPU unit.

### (3) Typical configuration

NOTE
<ul> <li>Use of the four-line simultaneous monitoring function requires the following version of ET.NET module: LWE550: Version 4, Revision 1 or later (2α series) LQE020: Version 3, Revision 1 or later (S10mini series)</li> <li>If an attempt is made to connect one CPU unit with two or more personal computers and the version of the ET.NET module employed is earlier than shown above, the following error message appears on the display to indicate that it cannot enter an on-line condition with the personal computers.</li> </ul>
• Ladder chart system versions 7 and later also support the four-line simultaneous monitoring function. However, the number of personal computers that can be connected with one PCs unit is limited to four including the ladder chart system (the unit dedicated to monitoring is also included) and HI-FLOW system (the unit dedicated to monitoring is also included). Even when two ET.NET modules (main module and submodule) are mounted in one PCs unit, the maximum number of connectable personal computers is 4.

# 4.7

**HI-FLOW Process Sheet Utility Functions** The HI-FLOW process sheet utility functions are selectable from a pull-down menu.

Number of all pro	cesses : 12 Kind of comr	nunication : R	S-232C COM1		Online
			]	1,1	0,0 0,0 //

The utility functions are described below.

No.	Level 1	Level 2	Level 3	Description
1	Utility	Setup the environment	Setup Tool-bar	Sets buttons on the toolbar.
2			Setup Display position	Sets the positions where structures, labels, or comments are to be displayed by default.
3			Background color	Sets the background color to be used for a sheet in each mode.
4			Paste	Selects between the "overwrite" and "insert" modes of pasting.
5		Converter		Converts the source code created by a DOS version of the HI-FLOW system.
6		MCS		Reads or writes memory.
7		PCs	Change connection of PCs	Sets a type of communication with the PCs.
8			Change PCs status	Forcibly stops the PCs or releases the PCs from their forcibly stopped state.
9			System edition	Sets conditions and an environment required for operation on the PCs.
10			Delete process of PCs	Replaces or deletes the HI-FLOW system.
11			Layout system bits	Sets a bit-type PI/O register so as to reflect the run state on the PCs.

No.	Level 1	Level 2	Level 3	Description
12	Utility	Process	Interrelation	Displays the correlation between processes
	(continued	(continued from	chart of	and their names.
	from the	the previous	processes	
13	previous	page)	Total Process	Displays the capacity of total processes.
	page)		capacity	
14			Restart process	Forcibly restarts the processes on the PCs
				from their current states.
15			Process ACT	Starts the processes on the PCs from their
				current states.
16			Process RST	Resets the processes on the PCs from their
				current states.
17			Process STP	Stops the processes on the PCs from their
				current states.
18			Process CLR	Clears the processes on the PCs from their
				current states.
19		PI/O	Delete unused	Deletes unused PI/O registers.
			PI/O	
20		Free forced		Forcibly unlocks the PCs.
		occupancy		
21		Wait information		Displays a symbolic figure, syntax, or the like
		list		for a process stop step.

Free forced occupancy is related to the network-compatible function described in "4.6 HI-FLOW Process Sheet Mode Functions." If the HI-FLOW system becomes disconnected for some reason from the PCs being locked by it, the PCs may be left locked and, as a result, may no longer be connected to any personal computer. In such a case, use the free forced occupancy function to forcibly release the PCs from the locked state.

### NOTE

The free forced occupancy function can be executed even when another user is keeping the PCs locked. If it is executed in such a situation, the other user who has been keeping the PCs locked is not notified of the fact. This may cause multiple simultaneous accesses to the same PC in some operation. To prevent this, check for any warning message indicating that another user is keeping the PCs locked, before using the free forced occupancy function.

# 4.8 HI-FLOW Process Sheet Window Functions

The HI-FLOW process sheet window functions are selectable from a pull-down menu.

🚅 HI-FLOW -	[old.hif]					_ 🗆 ×

The window functions are described below.

No.	Level 1	Level 2	Level 3	Description
1	Window	Display in piles		Cascades windows.
2		Display in order		Tiles windows.
3		Align icons		Arranges icons.
4		Close all sheets		Closes all process detail sheets that are
				currently open.
5		File names 1, 2,		Selects the active window.

### 4.9 Creating HI-FLOW Sheets

HI-FLOW sheets for 256 processes are available. They are opened from HI-FLOW process sheets. To open a HI-FLOW sheet, double-click the sheet icon on the HI-FLOW process sheet. Write a HI-FLOW program on the HI-FLOW sheet and save it. The HI-FLOW sheet will then be registered on the HI-FLOW process sheet.

<HI-FLOW process sheet and HI-FLOW sheet>

<HI-FLOW symbol bar>

The HI-FLOW symbol bar contains the following symbols, which are listed as arranged on the bar from left to right.

- Start process
- Se
- Terminate process
- Wait
- Box
- Control box
- Call
- Parallel start
- Parallel end
- Start of route
- Termination of route

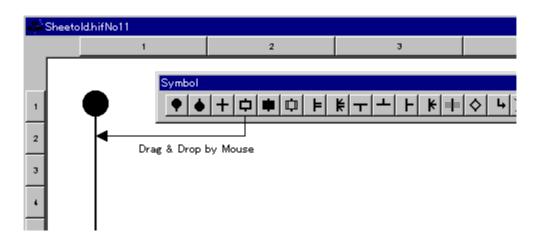

- Select
- Cell end
- Cell wait
- If
- Jump
- Escape
- Start of repeat
- Termination of repeat
- Function
- Clear wait

4.9.1 Pasting HI-FLOW symbols

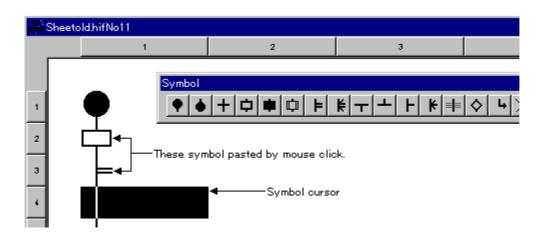

There are several methods of pasting HI-FLOW symbols to sheets. Select the desired method from among those listed below.

(1) Drag-and-drop with the mouse

Drag the desired symbol from the symbol bar to the position where to paste the symbol, and drop the symbol.

(2) Pasting at the input cursor position with the mouse Click the desired symbol on the symbol bar. The symbol will then be pasted at the symbol cursor position.

(3) Repetitive inputs of a specified symbol with the mouse

Select (repetitive) from the edit bar. The specified symbol can then be input repeatedly. Click the position on the sheet into which to paste the symbol. The symbol will then be pasted into that position. To cancel repetitive inputs, select (repetitive) again from the edit bar.

		1	2	з	
	•	Symbol			
1	•	•	+ <b>Þ Þ Þ</b>	<u>₩</u>	· 🔷 🖌
2			Pastir	ng by mouse click.	

(4) Pasting with keys

A symbol can be pasted by a specified combination of key strokes at the symbol cursor position on the sheet. To move the symbol cursor, use the  $[\leftarrow], [\rightarrow], [\uparrow], and [\downarrow]$  arrow keys. Key strokes can be customized by selecting [Utility] menu – [Keyboard].

<[Customize the key position of symbol.] window>

Kind of communication : RS-23	15 WT001 (40) 15 OFF R001 2C COM1	22WT001(40) 22OFF R001	Overwrite Offline

The mode functions are described below.

No.	Level 1	Level 2	Level 3	Description
1	Mode	Online	Send	Transmits a process to the PCs and enables
			(PC -> S10)	online mode.
2			Receive	Receives a process from the PCs and enables
			(S10 -> PC)	online mode.
3			Unconditional	Always enables online mode.
4		Offline		Switches to offline mode.
5		Free occupancy		Releases the lock set by the local personal
				computer.
6		Rewrite	Step	Rewrites the program contents stored in the
				PCs (the syntax/comments in a step are the
				target).
7			Process	Rewrites the program contents stored in the
				PCs (all items within a process are the target).
8		Monitor	Start monitoring	Starts monitoring.
9			Stop monitoring	Stops monitoring.
10			Step	Monitors the passing from step to step.
11			Token	Monitors tokens.
12			I/O	Monitors the setting and resetting of bits.
13			Clear	Initializes the maintained trace of execution.

No.	Level 1	Level 2	Level 3	Description
14	Mode	Debug	Trace	Traces and displays the operation of a
	(continued			process, starting when a given start condition
	from the			is met and ending when a given end condition
	previous			is met.
15	page)		Time monitor	Monitors time elapse from the time when a given start condition is met until when a given end condition is met.
1.6	ł			<u> </u>
16	ļ		Breakpoint	Sets or removes breakpoints.
17			Execution point	Moves the cursor to an execution point.

Any HI-FLOW system on a network has a lock function compatible with that network. This is to prevent multiple such HI-FLOW systems from accessing the same PC simultaneously. When online mode is specified, the connected PCs are locked. The locked PCs are unlocked when the user selects the free occupancy menu.

Online mode may not be specified for the PCs that are already locked by the HI-FLOW system on another personal computer. If this happens, an error message is displayed and the specified online mode is invalidated.

4.14.1 Overview of a rewrite during a run

In marked contrast to the other functions, the run-time rewrite function can seriously affect the plant facilities, depending on its use. Therefore, this function is particularly explained below in detail.

# 

The run-time rewrite function for a HI-FLOW program can seriously affect the plant facilities depending on its use. If you are not familiar with the HI-FLOW program processes, do not attempt to rewrite during a run but rewrite while the CPU is stopped.

(1) Functionality

This function enables you to rewrite a HI-FLOW program during a run (i.e., during an on-line condition). This run-time rewrite function offers three functions: step rewrite, process rewrite, and register value rewrite.

- (2) Run-time rewrite function overview
  - Step rewrite

If the [Rewrite] – [Step] is selected from the [Mode] menu, it will be in a step rewriting state. Again, if the [Rewrite] – [Step] is selected from the [Mode] menu, a step rewriting state will be canceled.

The step rewrite function allows you to rewrite the syntax used in a step. However, it does not enable you to rewrite the syntax in such a manner as to increase its size or the size of comments.

• Process rewrite

If the [Rewrite] – [Process] is selected from the [Mode] menu, it will be in a process rewriting state. Again, if the [Rewrite] – [Process] is selected from the [Mode] menu, a process rewriting state will be canceled.

The process rewrite function is newly offered by Version 7. It offers all the editing functions that can be exercised in an off-line condition, such as step size increase, step addition, and step deletion.

• Register value rewrite

This function permits you to change a register value within a HI-FLOW program in an on-line condition. If a symbol is double-clicked at the time of online, the list of the registers currently used as the applicable symbol is displayed, and the value of a register can be changed.

- (3) Limitations
  - Step rewrite

The step rewrite function does not perform a rewrite in such a manner as to increase the size of the syntax or comments within a step.

- Process rewrite
  - When the process rewrite function is exercised, no limitations are imposed on editing within a process detail window. However, you cannot change the right of interaction with a detail window or a list window.
  - Version 7 does not allow you to set the run-time rewrite mode during the monitoring or debugging state.
- Register value rewrite

Register values cannot be rewritten in an off-line condition or process rewrite mode.

(4) Program execution state synchronization in process rewrite mode When the following conditions are met, the process rewrite mode achieves synchronization with the HI-FLOW program status prevailing before a rewrite.

If the conditions are not met, process initialization takes place (by clearing the process execution state and then executing from the beginning of the process [in the same manner as for a process restart]).

<Synchronization conditions>

- No symbolic figure for a program is added, deleted, or changed.
- No label (label or free label) is added, deleted, or changed (jump source changes are allowable).
- No addition, deletion, or change is made to the route structure.

- No monitoring or debugging process can be performed in the run-time rewrite mode for a HI-FLOW program.
- Even if a rewrite is performed during a run, the PI/O register status remains unchanged. Therefore, do not perform a run-time rewrite until you have given adequate consideration to resulting program operations.
- If one or more calling processes exist in a process rewritten in the process rewrite mode, they (nesting processes included) reset.

- (5) Timer/loop counter processing after a process rewrite Timer/loop counter processing after a process rewrite is described below. Timer/loop counter processing is performed as described below no matter whether the synchronization conditions stated in (4) above are met.
  - A parallel timer (PTXXX) or wait timer (WTXXX) used within a rewritten process resets (i.e., the elapse value reaches 0 and invokes a timer stop) without regard to the process startup conditions (TUP, TRS, or unspecified). The status of a specified PI/O register for a parallel timer remains the same as before a rewrite. When control stays at a wait timer and the synchronization conditions are met, a counting sequence starts again from 0.
  - If a loop counter (CNXXX) is already running within a rewritten process, it unconditionally resets. (i.e., the elapse value is automatically set equal to its set final value.) As a result, it exits the loop when a loop check is conducted after a rewrite. It means that the loop comes to an end when the synchronization conditions are met upon a process rewrite in situations where control stays between the loop start and loop end.
  - If a box symbol is used in an ON statement within a rewritten process with MRST selected as a process startup condition, the register(s) used in the ON statement are cleared except when no such registers are specified.
  - If the CALL symbol is used within a rewritten process, the called process is executed starting from its beginning after a rewrite. Timers and loop counters at the call destination and register(s) in the ON statement are processed in accordance with CALL startup conditions. A parallel timer within the called process is retained if the call specifies nothing. Therefore, a wait state continues until an unrewritten timer is freed. To avert such a wait state, it is necessary to place a call with TRS or TUP specified. The elapse value of a wait timer or loop counter is retained if the call specifies nothing. However, a counting sequence starts from 0 upon reexecution.

Example.		
Process name	Processing	Description
PO	ACT P1, MRST, TUP	The P0 performs a master reset/timeout startup of the P1.
P1	ON MFF0	The P1 issues a master reset call to the P2.
	CALL P2	
P2	ON Y000	(Execution in progress)

Example:

<User operation>

Rewriting the P1 process, compiling it, and transmitting it. (See "(7) Procedures for performing a rewrite during a run.")

<Internal process>

- Since the P1 is started in MRST mode, the MFF0 of the P1 resets. (i.e., it is cleared to 0.) However, the Y000 of the P2 remains unchanged.
- When a timer is used by the P1, a timer reset process is performed without regard to the TUP selection for the P0 (caller's route process). When a timer is used by the P2, a reset process is not performed.

The list below shows the possible timer, loop counter, and PI/O register states prevailing after a process rewrite.

	Process startup condition	Timer/loop counter state
Process rewritten	Unspecified	An unconditional reset is performed. (The parallel
	TUP	timer stops. The wait timer restarts counting from 0. The elapse value of the loop counter is set equal to its
TRS	TRS	set final value so as to exit the loop.)
Called process	Unspecified	The elapse value remains unchanged. The following occurs upon reexecution. Parallel timer : Maintains a wait state until the unrewritten timer times out. Wait timer : Starts counting again from 0. Loop counter : Starts counting again from 0.
	TUP	Times out.
	TRS	Resets.

<List of the possible timer and loop counter states prevailing after a process rewrite>

<List of the possible PI/O register states prevailing after a process rewrite>

	Process startup condition	PI/O register state
Process rewritten	Unspecified	Retains the state that prevailed before a rewrite.
	MRST	Clear to 0.
Called process	Unspecified	Retains the state that prevailed before a rewrite.
	MRST	Clear to 0.

- (6) Breakpoint-setting process in process rewrite mode Performing a process rewrite deletes all set breakpoints without regard to the selection of the synchronization option or the occurrence of a break.
- (7) Procedures for performing a rewrite during a run
  - Step rewrite
    - ① With the process detail window open in an on-line condition, select [Mode] menu [Rewrite] [Step].
    - ② Select the step to be rewritten.
    - ③ The [Property of symbol.] dialog box is displayed.
    - ④ The [Property of symbol.] dialog box allows you to edit the syntax and comments. Use the same editing procedures as in an off-line condition.
    - (5) After completion of a rewrite, click the OK button in the dialog box. The system then automatically performs compilation and transmission processes.
  - Process rewrite
    - ① With the process detail window open in an on-line condition, select [Mode] menu [Rewrite] [Process].
    - 2 You can rewrite a target symbolic figure or syntax (see NOTE below). Use the same procedure as in an off-line condition.
    - ③ After completion of a rewrite, select [Build] menu [Compile].
    - ④ Select [Mode] menu [Online] [Send].

# NOTE

The process rewrite procedure differs from the step rewrite procedure. Exercise due care not to perform an incorrect procedure.

- Register value rewrite
- ① Double-click a symbol in an on-line condition. The system then displays the [Property of symbol.] dialog box in the on-line condition.

Property of symbol.	×
Current value	
Fw410 = H0000 (0) Fw402 = H0000 (0)	Setup <u>(S</u> )
OK Cancel Apply	Help

② Double-click the register whose value is to be rewritten. The [Data Set] dialog box is displayed.

Data Set	×
0000	ОК
<ul> <li>○ Decimal(<u>D</u>)</li> <li>⊙ Hexadecimal(<u>H</u>)</li> </ul>	Cancel

③ Enter a value and then click the OK button.

(8) Remedies for memory insufficiency during a run-time rewrite

An unoccupied HI-FLOW user program area on the PCs side is used to perform a rewrite while a HI-FLOW program is running. (The user program area is an area that is specified from [System edition], which can be accessed by selecting [PCs] from [Utility].) Therefore, if an attempt is made to perform a run-time rewrite repeatedly, the following message may be displayed to indicate memory insufficiency.

When the above message is displayed, you can achieve recovery from memory insufficiency by sending all processes to the PCs as directed below. To achieve recovery, however, you must stop the PCs.

- ① Stop the PCs.
- ② Place the PCs and HI-FLOW system in an off-line condition (by selecting [Mode] and then [Offline]).
- ③ Send all processes to the PCs (by selecting [Mode] menu, [Online], [Send], and then [All processes]).
- ④ Start the PCs.

If you do not want to stop the PCs, you should define an extra-large user program area beforehand from [System edition].

If the above procedure does not remedy the memory insufficiency problem on the PCs side, you must extend the user program area or add extended memory.

#### 4.14.2 Process execution after a run-time rewrite

A synchronization process is performed in some run-time rewrite operations and not in the others. This section explains about risks in various run-time rewrite operations.

# Synchronization process execution The synchronization process is performed when all the following conditions are met.

### <Synchronization conditions>

- No symbolic figure of a program is added, deleted, or changed.
- No label (label or free label) is added, deleted, or changed.
- No addition, deletion, or change is made to the route structure.

The synchronization process is significant when control stays in the process to be rewritten during a run. More specifically, it means that the location (step) at which control stays in an unrewritten process is retained even after the process is rewritten. Therefore, it involves the following risks.

- The stop conditions can be rewritten. Therefore, a previously unexecuted process may be executed, in which case there may occur a facility malfunction or, in a worse case, an accident.
- The stop conditions can be rewritten. Therefore, a previously executed process may be left unexecuted, in which case there may occur a facility synchronization failure.
- The control process numbers, which are the ACT, RST, STP, and CLR parameters for the control box, can be changed. Therefore, there may occur a facility malfunction or, in a worse case, an accident.
- A process to be called in the control box can be changed. Therefore, there may occur a facility malfunction or, in a worse case, an accident.

(2) Initialization process executionThe initialization process is executed when any of the following conditions is met:

<Initialization conditions>

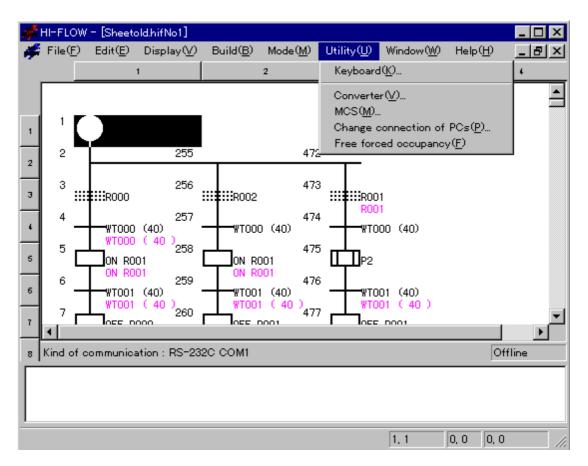

- A symbolic figure of a program is added, deleted, or changed.
- A label (label or free label) is added, deleted, or changed.
- An addition, deletion, or change is made to the route structure.

The initialization process is significant when control stays in the process to be rewritten during a run. More specifically, it means that execution starts from the beginning of a rewritten process without regard to the location (step) at which control stays in an unrewritten process. Therefore, it involves the following risk.

• Since execution starts from the beginning of a process, a synchronization failure may occur with respect to another process, resulting in an accident.

### 4.15 HI-FLOW Sheet Utility Functions

The HI-FLOW sheet utility functions are selectable from a pull-down menu.

The utility functions are described below.

No.	Level 1	Level 2	Level 3	Description
1	Utility	Keyboard		Assigns short-cut keys for symbol entry from
				the keyboard.
2		Converter		Converts the source code created by a DOS
				version of the HI-FLOW system.
3		MCS		Reads or writes memory.
4		Change connection		Sets a type of communication with the PCs.
		of PCs		
5		Free forced		Forcibly unlocks the PCs.
		occupancy		

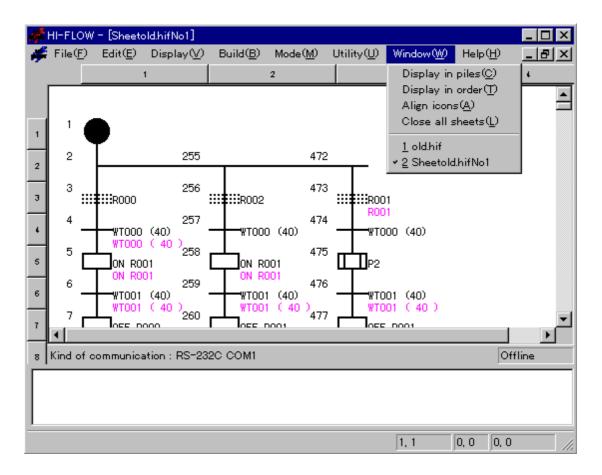

Free forced occupancy is related to the network-compatible function described in "4.14 HI-FLOW Sheet Mode Functions." If the HI-FLOW system becomes disconnected for some reason from the PCs being locked by it, the PCs may be left locked and, as a result, may no longer be connected to any personal computer. In such a case, use the free forced occupancy function to forcibly release the PCs from the locked state.

### NOTE

The free forced occupancy function can be executed even when another user is keeping the PCs locked. If it is executed in such a situation, the other user who has been keeping the PCs locked is not notified of the fact. This may cause multiple simultaneous accesses to the same PC in some operation. To prevent this, check for any warning message indicating that another user is keeping the PCs locked, before using the free forced occupancy function.

### 4.16 HI-FLOW Sheet Window Functions

The HI-FLOW sheet window functions are selectable from a pull-down menu.

The window functions are described below.

No.	Level 1	Level 2	Level 3	Description
1	Window	Display in piles		Cascades windows.
2		Display in order		Tiles windows.
3		Align icons		Arranges icons.
4		Close all sheets		Closes all process detail sheets that are
				currently open.
5		File names 1, 2,		Selects the active window.
